# Motivation

# Motivation

It has been proven that if a **dagger** category  $(\mathcal{C}, (-)^\dagger)$  satisfies certain axioms, it is equivalent to  $\text{Hilb}_k$ , with  $k \in \{\mathbb{R}, \mathbb{C}, \mathbb{H}\}$  [HK22], [LT25], [PV25].

This work is a **non-dagger** analogue of the above.

**Question:** What axioms must a category  $\mathcal{C}$  satisfy to guarantee:

$$\mathcal{C} \simeq \text{Vect}_k ?$$

Compare with [Freyd64] characterizing  $\text{Mod}_R$  for a ring  $R$ .

# The axioms

# The category $\text{Vect}_k$

Let  $k$  be a division ring. The category  $\text{Vect}_k$  has:

- $k$ -vector spaces as objects,
- a morphism  $A \rightarrow B$  is a  $k$ -linear function.

Let us study  $\text{Vect}_k$ .

## Observation 1

The 0-dimensional vector spaces  $\{0\}$  has the property that for any other vector spaces  $A, B$ , we have:

$$A \xrightarrow{\exists!} \{0\} \xrightarrow{\exists!} B$$

# The category $\text{Vect}_k$

Let  $k$  be a division ring. The category  $\text{Vect}_k$  has:

- $k$ -vector spaces as objects,
- a morphism  $A \rightarrow B$  is a  $k$ -linear function.

Let us study  $\text{Vect}_k$ .

## Definition

Let  $\mathcal{C}$  be a category. A *zero object* is an object  $0 \in \mathcal{C}$  with the property that for all  $A, B$ :

$$A \xrightarrow{\exists!} 0 \xrightarrow{\exists!} B$$

The composite above is then called the *zero map*  $0 : A \rightarrow B$ .

# Biproducts (1/2)

## Observation 2

When  $A, B$  are  $k$ -vector spaces, we may form their *biproduct*  $A \oplus B$ . Its elements are ordered pairs  $(a, b)$  with  $a \in A, b \in B$ .

$$\begin{array}{ccccc}
 A & \xleftarrow{\pi_A} & A \oplus B & \xrightarrow{\pi_B} & B \\
 & \xrightarrow{\iota_A} & & \xleftarrow{\iota_B} & \\
 & & & & 
 \end{array}$$

- We have  $\pi_A(a, b) = a$ ,  $\iota_A(a) = (a, 0)$ ,
- Any linear map  $\varphi : A \oplus B \rightarrow C$  corresponds to  $(\varphi' : A \rightarrow C, \varphi'' : B \rightarrow C)$ ,
- Any linear map  $\psi : C \rightarrow A \oplus B$  corresponds to  $(\psi' : C \rightarrow A, \psi'' : C \rightarrow B)$ .

# Biproducts (1/2)

## Definition

Let  $A, B$  be objects in a category  $\mathcal{C}$  with a zero object  $0$ . Their *biproduct* is a diagram:

$$\begin{array}{ccccc}
 A & \xleftarrow{\pi_A} & A \oplus B & \xrightarrow{\pi_B} & B \\
 & \xrightarrow{\iota_A} & & \xleftarrow{\iota_B} & \\
 & & & & 
 \end{array}$$

Such that:

- $\pi_A \circ \iota_B = 0, \quad \pi_B \circ \iota_A = 0,$
- $(\iota_A, \iota_B)$  is the coproduct of  $A, B$  in  $\mathcal{C}$ ,
- $(\pi_A, \pi_B)$  is the product of  $A, B$  in  $\mathcal{C}$ .

## Biproducts (2/2)

### Observation 3

For every injective linear function  $i : A \rightarrow B$  we can find  $r : B \rightarrow A$  such that  $r \circ i = 1_A$ .

We say that  $i$  is a *split monomorphism* or a *section*, with  $r$  being its *retraction*.

In  $\text{Vect}_k$ , any such pair can be completed into a biproduct:

$$\begin{array}{ccccc} A & \xleftarrow{r} & B & \overset{\text{---}}{\longrightarrow} & A' \\ & \xrightarrow{i} & & \overset{\text{---}}{\longleftarrow} & \\ & & & & \end{array}$$

Proof: consider  $p := i \circ r : B \rightarrow B$ , we have  $B \cong A \oplus \text{Ker}(p)$ .

# Simple object

## Observation 4

The 1-dimensional  $k$ -vector space  $I$  has a special property: An injective linear function  $U \rightarrow I$  is either zero, or it is an isomorphism.

## Definition

An object  $I \in \mathcal{C}$  is called *simple* when any nonzero monomorphism  $A \rightarrow I$  is an isomorphism.

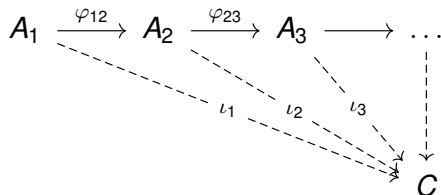

In addition, for a nonzero  $k$ -vector space  $A$ :

- there exists a nonzero linear function  $I \rightarrow A$ ,
- any such function is a split monomorphism.

## Directed colimits (1/2)

Denote by  $(\mathbf{Vect}_k)_{\text{mono}} \subseteq \mathbf{Vect}_k$  the subcategory of injective linear maps.

Let  $(P, \leq)$  be a directed poset. Consider a functor  $P \rightarrow (\mathbf{Vect}_k)_{\text{mono}}$ . It is a directed diagram of  $k$ -vector spaces:

In  $(\mathbf{Vect}_k)_{\text{mono}}$  this exists. Also  $\text{Span}(\bigcup_{i \in P} \text{Im}(\iota_i)) = C$ .

We say that the family  $\{\iota_i, i \in P\}$  is *jointly epic*.

## Directed colimits (2/2)

### Theorem

The category  $(\mathbf{Vect}_k)_{\text{mono}}$  admits directed colimits and the inclusion functor  $(\mathbf{Vect}_k)_{\text{mono}} \rightarrow \mathbf{Vect}_k$  preserves jointly epic families of morphisms.

# The main result

# Summary

## Observation

The category  $\mathbf{Vect}_k$  has the following properties:

- (V1) it has finite biproducts.
- (V2) every pair  $(s, r)$  of a section and a retraction can be completed to a biproduct,
- (V3) the 1-dimensional vector space  $I$  is simple and for any nonzero vector space  $A$ :
  - (V3)(a) there exists a nonzero morphism  $I \rightarrow A$ ,
  - (V3)(b) every nonzero morphism  $I \rightarrow A$  is injective.
- (V4)  $(\mathbf{Vect}_k)_{\text{mono}}$  admits directed colimits and the inclusion  $(\mathbf{Vect}_k)_{\text{mono}} \rightarrow \mathbf{Vect}_k$  preserves jointly epic families of morphisms.

## Theorem

Let  $\mathcal{C}$  be a category. Assume the following:

- (V1)  $\mathcal{C}$  has finite biproducts,
- (V2) every pair  $(s, r)$  of a section and a retraction can be completed to a biproduct,
- (V3) there is a simple object  $I$  and for any nonzero object  $A$  we have:
  - (V3)(a) there exists a nonzero morphism  $I \rightarrow A$ ,
  - (V3)(b) every nonzero morphism  $I \rightarrow A$  is a split monomorphism,
- (V4) the subcategory  $\mathcal{C}_{\text{split mono}}$  admits directed colimits and the inclusion  $\mathcal{C}_{\text{split mono}} \rightarrow \mathcal{C}$  preserves jointly epic families of morphisms.

Then there exists a division ring  $k$  and an equivalence:

$$\mathcal{C} \simeq \text{Vect}_k.$$

# Future work

# The dagger version

A *dagger category*  $\mathcal{C}$  is a category equipped with an involutive functor  $(-)^{\dagger} : \mathcal{C}^{op} \rightarrow \mathcal{C}$  that is the identity on objects.

Example: a  $*$ -monoid  $M$ ,  $\mathbf{Rel}$ ,  $\mathbf{Hilb}_{\mathbb{C}}$ .

Given  $f : \mathcal{H} \rightarrow \mathcal{K}$ , its adjoint  $f^{\dagger} : \mathcal{K} \rightarrow \mathcal{H}$  is uniquely determined by the property that for all  $u \in \mathcal{H}$ ,  $v \in \mathcal{K}$ :

$$\langle f(u), v \rangle = \langle u, f^{\dagger}(v) \rangle.$$

A biproduct  $\mathcal{H} = U \oplus V$  is a *dagger-biproduct* if  $U^{\perp} = V$ ,  $V^{\perp} = U$ .

A *dagger-monomorphism*  $f$  is a morphism satisfying  $f^{\dagger} \circ f = 1_{\mathcal{H}}$ .  
Isometries.

## Theorem

Let  $\mathcal{C}$  be a category. Assume the following:

- (V1)  $\mathcal{C}$  has finite biproducts,
- (V2) every pair  $(s, r)$  of a section and a retraction can be completed to a biproduct,
- (V3) there is a simple object  $I$  and for any nonzero object  $A$  we have:
  - (V3)(a) there exists a nonzero morphism  $I \rightarrow A$ ,
  - (V3)(b) every nonzero morphism  $I \rightarrow A$  is a split monomorphism,
- (V4) the subcategory  $\mathcal{C}_{\text{split mono}}$  admits directed colimits and the inclusion  $\mathcal{C}_{\text{split mono}} \rightarrow \mathcal{C}$  preserves jointly epic families of morphisms.

Then there exists a division ring  $k$  and an equivalence:

$$\mathcal{C} \simeq \text{Vect}_k.$$

## Theorem [PV25]

Let  $\mathcal{C}$  be a **dagger** category. Assume the following:

- (H1)  $\mathcal{C}$  has finite **dagger** biproducts,
- (H2) every **dagger monomorphism** can be completed to a **dagger** biproduct,
- (H3) there is a simple object  $I$  and for any nonzero object  $A$  we have:
  - (H3)(a) there exists a nonzero morphism  $I \rightarrow A$ ,
  - (H3)(b) every nonzero morphism  $I \rightarrow A$  is isomorphic to a **dagger monomorphism**,
- (H4) the subcategory  $\mathcal{C}_{\text{dagger mono}}$  admits directed colimits and the inclusion  $\mathcal{C}_{\text{dagger mono}} \rightarrow \mathcal{C}$  preserves jointly epic families of morphisms.
- (H5) Every **dagger automorphism** has a strict square root.

Then there exists a **dagger** equivalence  $\mathcal{C} \simeq \text{Hilb}_{\mathbb{C}}$ .

Axioms are similar, but why?
